## **CLAIMS**

## What is claimed is:

- 1. A method for compressing still images that are stored in electronic media comprising the step of:
  - a. selecting the image to be compressed;
  - b. selecting the desired degree of compression;
  - c. constructing filters, based on the desired degree of compression and physical characteristics of the image, for decomposition of the image by non-seperablen wavelet transformation
  - d. transforming the image into an array of frequency coefficients of the pixels by executing one level of decomposition for each of the three filters;
  - e. quantizing the values of the frequency coefficients; and
- f. encoding the quantized values by run length and arithmetic coding methods; whereby the image is restored in the YCbCr format through the use of a pre-designated reconstruction formula; and transformed into the RGB palette after reconstruction is complete.
